Report Overview

Acetylcholine chloride acts as an endogenous neurotransmitter at cholinergic synapses. The compound has been shown to have ophthalmological uses and can be broken down quickly by cholinesterases. Acetylcholine influences many basic cells functions, such as mitosis, cells differentiation, cytoskeletal organization, and cell to cell contact, among other functions. It reduces mortality and plasma proinflammatory cytokines in mice with experimentally-induced sepsis. The cholinergic anti-inflammatory mechanism is probably mediated by interaction of acetylcholine with α_7 cholinergic receptor on monocytes, macrophages, and neutrophils, which decreases the levels of proinflammatory cytokines such as TNF- α , IL-1 β , and IL-6.
