Report Overview

Acid Citrate Dextrose (ACD) tubes are specialized blood collection tubes containing an anticoagulant solution composed of citric acid, sodium citrate, and dextrose. These tubes are primarily used for preserving whole blood samples in immunohematology, molecular testing, and blood banking, particularly for procedures such as HLA typing, paternity testing, and DNA extraction. The ACD solution prevents coagulation by chelating calcium ions while maintaining cell viability and stability, making it critical for applications requiring high-quality genetic material. The global market for ACD tubes is driven by increasing demand for blood transfusions, genetic research, and diagnostic testing, particularly in hematology and transfusion medicine. Growth is further supported by rising investments in healthcare infrastructure, advancements in molecular diagnostics, and the expansion of blood banks and biobanking facilities. However, stringent regulatory requirements and competition from alternative anticoagulant tubes (such as EDTA or heparin tubes) pose challenges. Key players in this market include Becton Dickinson, Greiner Bio-One, Terumo Corporation, and others, who focus on product innovation and compliance with international standards to maintain competitiveness. Regional demand is highest in North America and Europe due to advanced healthcare systems, while Asia-Pacific shows rapid growth due to increasing healthcare expenditure and awareness of blood-related disorders.
