Report Overview

An Acousto-Optic Beam Deflector (AOBD) is a sophisticated optical device that manipulates and controls the direction of light beams using the principles of acousto-optics. It functions by utilizing an ultrasonic wave, generated within a crystal or other suitable medium, to create a diffraction grating. This grating interacts with an incident light beam, causing it to diffract and change direction. The deflection angle of the light beam is directly proportional to the frequency of the applied acoustic wave, allowing for precise control over the beam's trajectory. AOBDs are widely used in various applications, including laser scanning, optical data storage, and beam steering in scientific and industrial settings. They offer advantages such as high-speed response, compact size, and the ability to handle high laser powers, making them indispensable tools in fields requiring precise and dynamic control of light.
