### Report Overview

Active Band Pass Filters are electronic circuits designed to selectively allow signals within a specific frequency range to pass through while attenuating signals outside that range. These filters are called "active" because they require an external power source, typically a DC voltage, to operate. They are widely used in various applications, such as signal processing, communication systems, and audio equipment, to filter out unwanted frequencies and enhance the desired signal. Active Band Pass Filters can be implemented using operational amplifiers, transistors, or other active components, combined with passive elements like resistors, capacitors, and inductors. The key characteristics of these filters include their center frequency, bandwidth, and quality factor, which determine their performance in filtering signals.
