Abstracts

Active noise cancellation (ANC) is a system or technique of applying an anti-noise waveform, which closely matches the shape and frequency of the offending noise waveform, at an angle of precisely 180 degrees out of phase from the noise at the point which they both reach the target area. There are two basic methods used in ANC systems? adaptive cancellation, which uses one or more microphones to detect noise and then adapts to generate an anti-noise waveform; and the synthesis method, which involves sampling and storing a number of noise cycles and generating an anti-noise waveform based on the stored information.

The global Active Noise Cancellation Digital Signal Processor (DSP) market size was estimated at USD 4250.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
