Report Overview

An active vibration isolator for construction and semiconductor equipment is a specialized device designed to minimize the effects of vibrations on sensitive machinery used in construction and semiconductor industries. These isolators use active control systems to detect and counteract incoming vibrations, providing a stable and vibration-free environment for the equipment. Active vibration isolators typically consist of sensors, actuators, and control algorithms. The sensors detect vibrations in the surroundings while the actuators generate counteracting forces to cancel out these vibrations. The control algorithms analyze the sensor data and adjust the actuator forces accordingly to achieve optimal vibration reduction. By actively attenuating vibrations, these isolators help prevent potential damage to delicate equipment, improve precision, and enhance overall performance. They are commonly used in settings where vibrations generated by nearby machinery or environmental factors can negatively impact the accuracy and reliability of construction or semiconductor equipment.
