Abstracts

An ad hoc network chip is a specialized integrated circuit (IC) designed to enable the creation and operation of ad hoc networks. Ad hoc networks are wireless networks that are formed on the fly without the need for any pre-existing infrastructure or centralized control. These networks are typically formed by a group of devices that communicate directly with each other, allowing for peer-to-peer communication and collaboration. Ad hoc network chips provide the necessary hardware and software components to establish and maintain ad hoc networks. They typically include a radio transceiver for wireless communication, a microcontroller or processor for network management, and various protocols and algorithms for network formation, routing, and data transmission. These chips are commonly used in applications where traditional network infrastructure is unavailable or impractical, such as in disaster response scenarios, military operations, or remote areas with limited connectivity. They enable devices to quickly and autonomously form a network and communicate with each other, allowing for efficient and flexible communication in dynamic environments.

The global Ad hoc Network Chip market size was estimated at USD 4995.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
