Abstracts

Adeno-Associated Virus (AAV) particles are small, non-enveloped viruses that belong to the Parvoviridae family. AAV is commonly used in gene therapy and biotechnology as a vector for delivering genetic material into cells. AAV particles are characterized by their ability to infect a broad range of dividing and non-dividing cells, and they are considered relatively safe for therapeutic applications due to their low pathogenicity in humans. In gene therapy, AAV vectors are designed to carry therapeutic genes into target cells, allowing for the correction or replacement of defective genes. AAV particles have shown promise in various medical applications, and ongoing research aims to optimize their efficiency, specificity, and safety for use in treating genetic disorders and other diseases.
