Abstracts

Adeno-Associated Virus (AAV) vectors are small, non-pathogenic viruses that are widely used in gene therapy and biotechnology. These vectors are engineered to deliver therapeutic genes into targeted cells within the human body. AAVs are chosen for their ability to infect both dividing and non-dividing cells, as well as their low immunogenicity. In gene therapy, AAV vectors serve as carriers for introducing corrected or therapeutic genes into a patient's cells to treat genetic disorders or other medical conditions. Their stable and long-term expression in the host cells makes them valuable tools in advancing research and developing therapeutic interventions for various genetic and acquired diseases.

The global Adeno Associated Virus Aav Vectors market size was estimated at USD 2716.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
