Abstracts

NDIR gas sensors use the infrared absorption properties of gas molecules (e.g., CO₂) to calculate their concentration. Therefore, the NDIR gas sensor is equipped with an infrared light source that emits infrared rays and an infrared sensor that detects infrared rays. The infrared light is directed at the gas in the measuring tube and part of the light is absorbed by the gas molecules to be measured. Subsequently, the rest of the infrared light hits the filter and reaches the infrared detector. Ideally, only the gas to be measured absorbs light of the corresponding wavelength. However, since the gas mixture contains a variety of gases, the absorption regions may overlap, thus enhancing cross sensitivity. The interference part must either be tested for compensation (to avoid false measurements) or avoided by clever selection of spectral ranges. With the NDIR sensor, more than 100 different gases can be detected from ppm to percentage. In many applications, this is the preferred method because the measurement method is non-contact and non-consuming. The key players of Advanced NDIR Sensors include Amphenol Advanced Sensors, Senseair (Asahi Kasei Microdevices), Murata, Sensirion, and MKS Instruments. The top five manufacturers hold approximately 19% of the global market share, with Amphenol Advanced Sensors being the largest manufacturer with approximately 5% of the market share. North America, Europe and Asia-Pacific are the world's major production regions, with a combined market share of over 90%. North America is the world's largest Advanced NDIR Sensors production region, with nearly 33% market share, followed by Europe and Asia-Pacific, with 27% and 30% respectively.

The global NDIR Sensors market size was estimated at USD 925.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
