Report Overview

Afatinib Maleate Tablets are an oral tyrosine kinase inhibitor (TKI) used primarily for the treatment of metastatic non-small cell lung cancer (NSCLC) with specific epidermal growth factor receptor (EGFR) mutations, including exon 19 deletions and exon 21 (L858R) substitutions. As a second-generation EGFR TKI, Afatinib irreversibly binds to the EGFR, HER2, and HER4 receptors, inhibiting tumor growth and proliferation. It is often prescribed as a first-line therapy for eligible patients due to its efficacy in delaying disease progression compared to chemotherapy or first-generation TKIs like gefitinib or erlotinib. The drug is also being investigated for other cancer types with EGFR mutations, expanding its potential therapeutic applications. Market dynamics for Afatinib Maleate Tablets are influenced by the rising incidence of NSCLC, increasing adoption of targeted therapies, and advancements in companion diagnostics for mutation detection. However, competition from newer-generation TKIs like osimertinib, which offers improved resistance management and CNS penetration, poses a challenge. Pricing pressures, reimbursement policies, and the growing availability of biosimilars further shape the competitive landscape, particularly in emerging markets where cost sensitivity is higher.

This report provides a deep insight into the global Afatinib Maleate Tablets market covering all its essential aspects.
