### Report Overview

Agglomerated diamond (AD) refers to a synthetic diamond material composed of micron- or nano-sized diamond particles bonded together under high pressure and high temperature (HPHT) or chemical vapor deposition (CVD) processes, forming a polycrystalline structure with superior hardness, wear resistance, and thermal conductivity compared to single-crystal diamonds. This engineered material is widely used in cutting, grinding, drilling, and polishing applications across industries such as aerospace, automotive, electronics, and oil & gas due to its ability to maintain sharpness and durability under extreme conditions. Unlike natural diamonds, AD can be tailored for specific industrial needs by adjusting particle size, bonding methods, and additives, making it a cost-effective and high-performance alternative for precision machining and abrasive tools. The market demand is driven by advancements in manufacturing technologies, increasing industrial automation, and the need for high-efficiency tooling solutions in harsh environments.
