Report Overview

Agomelatine API, also known as Melatonin Receptor Agonist, is a pharmaceutical compound primarily used as an antidepressant. It functions by selectively binding to melatonin receptors (MT1 and MT2) and serotonin receptors (5-HT2C), thereby modulating the release of various neurotransmitters in the brain. This unique mechanism of action differentiates Agomelatine from traditional antidepressants, as it does not inhibit the reuptake of serotonin or norepinephrine. As a result, Agomelatine API is often prescribed for the treatment of major depressive disorders, with potential benefits including improved sleep quality and a reduced risk of sexual side effects commonly associated with other antidepressants. The API is a white to off-white crystalline powder, soluble in water, and is used as an active pharmaceutical ingredient in the formulation of tablets or capsules for oral administration.

In 2024, the global Agomelatine API market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
