Report Overview

Air Conduction Headphones are a type of audio device designed to deliver sound to the listener's ears without the need for direct contact with the eardrums. These headphones utilize a unique technology that transmits sound waves through the air, rather than through direct bone conduction as seen in bone conduction headphones. This design allows for a more natural listening experience, as it mimics the way we hear sounds in our everyday lives. Air Conduction Headphones are typically lightweight, comfortable, and provide a more open listening experience, as they do not block out external sounds completely. They are ideal for users who prefer a more immersive and less isolating audio experience, and are often used in situations where ambient noise awareness is important, such as during outdoor activities or in professional settings where communication with others is necessary.
