Report Overview

An Air Heat Source Pump (AHSP) is an energy-efficient heating and cooling system that utilizes the heat transfer properties of refrigerants to extract thermal energy from the ambient air. It functions by compressing and circulating a refrigerant through a closed loop system, which absorbs heat from the outside air even in cold temperatures. This heat is then transferred to a building's heating or cooling system, providing a sustainable and cost-effective alternative to traditional fossil fuel-based heating methods. AHSPs are known for their high efficiency, as they can generate up to three to four units of energy for every unit of electrical energy consumed, making them an environmentally friendly choice for both residential and commercial applications.
