Report Overview

The Air and Vapour Control Layer (AVCL) is a critical component in modern building construction, designed to regulate moisture and air movement within building envelopes. It acts as a barrier to prevent condensation, air leakage, and thermal inefficiencies, thereby enhancing energy efficiency and structural longevity. AVCLs are typically constructed from materials such as polyethylene, polypropylene, or bitumen-based membranes, and are installed in walls, roofs, and floors to maintain airtightness and moisture control. Their application is particularly vital in energy-efficient and passive house designs, where airtight construction is essential to meet stringent performance standards. The effectiveness of an AVCL depends on proper installation, material selection, and compatibility with other building components like insulation and vapor retarders.
