Abstracts

An air source heat pump for home heating is an energy-efficient heating system that extracts heat from the outdoor air and transfers it indoors to provide warmth during colder months. Operating on the principle of refrigeration, it uses a compressor and refrigerant to absorb heat from the outside air, even in low temperatures, and then releases it inside the home through a heat exchanger. This process can be reversed during the summer months to provide cooling. Air source heat pumps offer significant energy savings compared to traditional heating systems and are environmentally friendly, as they produce lower carbon emissions. They are a cost-effective and reliable solution for home heating and cooling needs, offering year-round comfort and sustainability.

The global Air Source Heat Pump For Home Heating market size was estimated at USD 25000.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
