Report Overview

The Aircraft Wheel Braking System is a critical component of an aircraft's landing gear system, designed to provide controlled deceleration and stopping capabilities during taxiing, takeoff, and landing. This system comprises a series of interconnected mechanical, hydraulic, and electronic components that work in tandem to apply pressure to the aircraft's wheels, thereby generating friction and slowing down the aircraft. Key elements of this system include the brake calipers, which clamp onto the wheels; the brake discs, which interact with the calipers to create friction; the hydraulic system, which supplies the necessary pressure to the calipers; and the control systems, which manage the braking force based on pilot inputs and aircraft speed. The Aircraft Wheel Braking System is engineered to meet stringent safety standards and is subject to regular maintenance and inspection to ensure optimal performance and reliability.
