### Report Overview

Adult CAR T-cell therapy is a form of immunotherapy that involves genetically modifying a patient's own T-cells to target and destroy cancer cells, primarily used in treating hematologic malignancies such as relapsed or refractory B-cell lymphomas and leukemias. Unlike pediatric applications, adult CAR T-cell therapy often addresses more complex and aggressive cancers in older populations, who may have comorbidities or reduced immune resilience. The therapy is highly personalized, requiring leukapheresis, ex vivo engineering of T-cells with chimeric antigen receptors (CARs), and reinfusion after lymphodepleting chemotherapy. While effective, challenges include cytokine release syndrome (CRS), neurotoxicity, high manufacturing costs, and limited accessibility due to specialized treatment center requirements. The market is driven by increasing cancer prevalence, advancements in gene-editing technologies, and growing approvals for new indications, though pricing and reimbursement hurdles remain significant barriers to broader adoption.

This report provides a deep insight into the global Adult CAR T-cell Therapy market covering all its essential aspects.
