Report Overview

Aliphatic isocyanate prepolymers are specialized chemical compounds derived from aliphatic isocyanates, which are known for their resistance to yellowing and UV degradation compared to aromatic counterparts. These prepolymers are typically formed by reacting aliphatic diisocyanates (such as HDI, IPDI, or H12MDI) with polyols, resulting in oligomers with reactive isocyanate (-NCO) end groups. They serve as key intermediates in the production of high-performance polyurethane coatings, adhesives, sealants, and elastomers, where durability, weatherability, and optical clarity are critical. Applications span industries such as automotive (clear coats, refinish paints), aerospace, construction, and industrial coatings, where long-term color stability and mechanical performance under harsh environmental conditions are essential. The versatility of these prepolymers allows for tailored formulations to meet specific viscosity, curing speed, and flexibility requirements, making them indispensable in premium coating systems.
