Report Overview

Alkaline colloidal silica is a stable dispersion of amorphous silicon dioxide nanoparticles in an alkaline aqueous solution, typically with a pH range of 9-11. It consists of spherical silica particles, usually between 5-100 nanometers in size, suspended uniformly in a liquid medium, often stabilized by sodium or potassium hydroxide. This product is known for its high surface area, stability, and reactivity, making it valuable in applications such as precision casting, refractory materials, coatings, catalysts, and electronics. Its alkaline nature enhances suspension stability and prevents particle aggregation, ensuring uniform dispersion, which is critical in industries requiring precise material performance. The controlled particle size and surface chemistry allow for tailored solutions in adhesion, binding, and reinforcement applications.
