## Abstracts

Alkaline waste can be solid or sludgy. It mostly involves slags, ashes or muds formed as a byproduct of steel, aluminium or coal power plants, waste incineration or the construction industry. All these wastes are different, but what they have in common is that they rapidly create bleach-like solutions when they meet rainwater. Often it's simply stored in piles or sent to landfill. This isn't safe. The waste can form toxic dust that blows into the atmosphere, while rain that lands on top can filter through, picking up toxic chemicals and producing caustic leachates that can flow out into rivers and groundwater. Therefore, the recycling of alkaline waste is very necessary.

The global Alkaline Waste Recycling And Recovery market size was estimated at USD 45.65 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
