Report Overview

Alkyl Modified Silicone Oil is a type of silicone oil that has been chemically modified by attaching alkyl groups to its molecular structure. This modification enhances the oil's compatibility with various materials, particularly organic substances, and improves its performance in applications such as lubrication, water repellency, and surface treatment. The alkyl groups, which are hydrocarbon chains, increase the oil's solubility in organic solvents and its ability to form stable emulsions. This product is often used in the manufacturing of textiles, coatings, and personal care products due to its unique properties that include reduced surface tension, improved wetting, and enhanced adhesion to treated surfaces. The alkyl modification also allows for better control over the oil's volatility and durability, making it a versatile component in industrial and consumer product formulations.
