Report Overview

Alumina hydrate, also known as aluminum hydroxide (Al(OH)₃), is a white, crystalline powder widely used as a flame retardant, filler, and precursor in the production of aluminum chemicals. It is valued for its non-toxicity, thermal stability, and ability to decompose endothermically, releasing water vapor that suppresses combustion. The compound is a key raw material in manufacturing aluminum oxide (alumina), which is further processed into aluminum metal. Additionally, it finds applications in pharmaceuticals, water treatment, ceramics, and adhesives due to its chemical inertness and adsorption properties. The market for alumina hydrate is driven by demand from the construction, automotive, and electronics industries, where flame retardancy and material reinforcement are critical. However, environmental regulations and competition from alternative flame retardants may influence market dynamics. Growth is also linked to the expansion of aluminum production, particularly in regions with strong industrial activity.
