Abstracts

Due to the unique properties of aluminum foil, it can be used as a positive electrode current collector for lithium ion batteries. The positive and negative current collectors of the battery are mainly used as the carrier of the electrode coating layer, which needs to gather the output or input current, and its surface characteristics will significantly affect the charge-discharge efficiency and the internal resistance of the battery. Due to the good conductivity and ductility of aluminum foil, soft texture, and the passivation layer on the surface will not be corroded by the electrolyte during the charging and discharging process, it is often used as the positive electrode current collector and ternary positive electrode material of lithium ion batteries, lithium iron phosphate and active materials such as lithium cobalt oxide.

The global Aluminium Foil For Lithium Battery market size was estimated at USD 2850.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.35% during the forecast period.
