Report Overview

The amniotic membrane, derived from the placental tissue of consenting donors, is a specialized biological material valued for its regenerative and anti-inflammatory properties. It consists of an epithelial cell layer, a thick basement membrane, and an avascular stroma, making it useful in wound healing, ocular surface reconstruction, and surgical applications. The membrane's natural growth factors, cytokines, and extracellular matrix proteins promote tissue repair while minimizing scarring and immune rejection. In the medical field, it is processed into grafts, patches, or cryopreserved sheets for use in ophthalmology, orthopedics, and chronic wound management. Its versatility and biocompatibility have driven adoption in both clinical and research settings, particularly for treating conditions like corneal ulcers, burns, and diabetic foot ulcers. The market for amniotic membranes is shaped by advancements in tissue processing, regulatory approvals, and the growing demand for minimally invasive regenerative therapies.
