Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Amorphous C Core competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Amorphous C Core is a magnetic component made of sliced ??amorphous C-shaped magnetic core strip with a "C"-shaped structure, which is convenient for coil winding and magnetic circuit installation. The atoms of amorphous materials are disordered, which is different from the traditional crystal structure of silicon steel, so it has extremely low iron loss, high magnetic permeability and excellent thermal stability. Compared with traditional magnetic cores, Amorphous C Core performs better in high-frequency and high-power density application scenarios, which can significantly improve system energy efficiency, reduce volume and weight, and reduce temperature rise and noise. Its C-shaped structure helps to close the magnetic circuit and improve the overall magnetic properties. It is widely used in high-frequency transformers, inductors, power factor correction circuits (PFC), solar inverters, electric vehicle charging systems, uninterruptible power supplies (UPS) and other equipment. Amorphous C Core has become an important core component for efficient energy conversion and stable magnetic field control in the fields of new energy, power electronics, industrial automation, etc.

The global Amorphous C Core market size was estimated at USD 204.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
