Report Overview

Anesthesia and Muscle Relaxants are pharmaceutical agents used in medical procedures to induce a state of temporary unconsciousness and immobility in patients. Anesthesia, which can be classified into general, regional, or local, is administered to prevent patients from feeling pain and discomfort during surgeries or other invasive medical interventions. General anesthesia affects the entire body, while regional and local anesthesia target specific areas. Muscle relaxants, also known as neuromuscular blocking agents, are used in conjunction with anesthesia to produce muscle paralysis, facilitating surgical procedures that require complete muscle relaxation. These agents work by blocking the transmission of nerve impulses to the muscles, thereby preventing muscle contractions. The combination of anesthesia and muscle relaxants is crucial for patient safety, surgical precision, and postoperative recovery.
