### Report Overview

Animal-derived heart valves, also known as bioprosthetic or tissue heart valves, are medical devices used to replace damaged or diseased heart valves, primarily in patients with valvular heart disease. These valves are sourced from porcine (pig) or bovine (cow) tissue, which is chemically treated to reduce immunogenicity and improve durability before being mounted on a synthetic or natural stent. Unlike mechanical valves, they do not require lifelong anticoagulation therapy, making them preferable for elderly patients, those with contraindications to blood thinners, or individuals seeking a more natural hemodynamic performance. However, their limited lifespan (typically 10-15 years) due to calcification and degeneration poses a challenge for younger patients, driving ongoing research into tissue engineering and anti-calcification treatments. The market for animal-derived heart valves is shaped by aging populations, rising prevalence of cardiovascular diseases, and advancements in minimally invasive surgical techniques, though competition from mechanical valves and emerging transcatheter options influences adoption trends. Regulatory approvals, cost-effectiveness, and patient-specific factors further define their positioning within the cardiac valve replacement sector.

This report provides a deep insight into the global Animal-derived Heart Valves market covering all its essential aspects.
