### Report Overview

Anionic polymerization initiators are chemical substances specifically used to start and promote anionic polymerization reactions. Anionic polymerization is a chain polymerization reaction in which the active center is an anion, which can continuously combine with monomer molecules to form a polymer chain. Anionic polymerization initiators usually include a variety of types, such as fluorinated compounds, sulfonates, etc., but more common are alkali metals (such as sodium, potassium, etc.) and organic metal compounds (such as alkyl lithium, alkyl sodium, etc.). These initiators have different initiation activities and reaction characteristics, and can be selected according to specific application requirements. Anionic polymerization initiators are widely used in manufacturing, especially in the fields of synthetic rubber, synthetic resin, plastics, coatings, etc. They can increase the rate and yield of polymerization reactions, help speed up the production process and improve production efficiency. In addition, anionic polymerization initiators are also used in the medical field, such as the preparation of acetal resin materials, drug sustained-release materials, etc.
