Report Overview

Anterior Midline Cervical Plates are medical devices specifically designed for use in spinal surgeries, particularly in the cervical region of the spine. These plates are typically made from biocompatible materials such as titanium or stainless steel and are intended to provide structural support and stability to the cervical vertebrae after procedures such as fusion or decompression. The "anterior" aspect of the name indicates that the plates are inserted from the front of the neck, as opposed to the posterior approach. The "midline" refers to the central location of the plates along the anterior aspect of the cervical spine. These plates are often used in conjunction with screws or bolts to secure them to the vertebrae, allowing for the immobilization of the spine and facilitating the healing process. They are an essential tool in spinal surgery, helping to correct spinal deformities, alleviate pain, and improve the patient's quality of life.
