Report Overview

Anti-caking agents for feed are additives used to prevent the clumping or caking of powdered or granulated animal feed ingredients, ensuring consistent texture, flowability, and ease of handling during storage and transportation. These agents work by absorbing excess moisture or coating particles to reduce cohesion, commonly utilizing materials such as calcium silicate, sodium aluminosilicate, kaolin, or magnesium oxide. Their application is critical in maintaining feed quality, preventing nutrient degradation, and optimizing processing efficiency, particularly in humid climates or for feeds prone to moisture absorption. The demand for these agents is closely tied to the livestock and aquaculture industries, where feed quality directly impacts animal health and production efficiency. Regulatory standards and consumer preferences for safe, non-toxic additives further influence product formulations and market dynamics.
