Report Overview

Anti-VEGF Injection is a type of medication used in the treatment of various eye conditions, particularly those involving abnormal blood vessel growth, such as age-related macular degeneration (AMD), diabetic macular edema (DME), and retinal vein occlusion (RVO). The term "Anti-VEGF" stands for "anti-vascular endothelial growth factor," which is a protein that stimulates the growth of new blood vessels. This medication works by inhibiting the action of VEGF, thereby preventing the formation of new, abnormal blood vessels in the eye. The injections are typically administered directly into the eye by a healthcare professional and are part of a treatment regimen that may include regular monitoring and follow-up injections to manage the condition effectively.
