Report Overview

Antimony Bismuth Telluride (Sb-Bi-Te) is a thermoelectric material primarily composed of antimony (Sb), bismuth (Bi), and tellurium (Te), often synthesized in varying stoichiometric ratios to optimize its thermoelectric properties. This semiconductor alloy is widely recognized for its high thermoelectric efficiency, particularly near room temperature, making it a key component in applications such as thermoelectric coolers, power generation modules, and waste heat recovery systems. Its performance is driven by a low thermal conductivity and a high Seebeck coefficient, which enable efficient conversion between thermal and electrical energy. Recent advancements in nanostructuring and doping techniques have further enhanced its figure of merit (ZT), solidifying its dominance in commercial thermoelectric applications. However, challenges such as material scarcity, high production costs, and brittleness limit large-scale adoption, prompting ongoing research into alternative compositions and scalable manufacturing methods. The market for Sb-Bi-Te is closely tied to industries like electronics, automotive, and aerospace, where energy efficiency and miniaturization are critical.
