### Report Overview

An Antivertigo Agent is a class of pharmaceuticals specifically designed to alleviate symptoms associated with vertigo, a condition characterized by the sensation of dizziness or spinning. These agents work by targeting the vestibular system in the inner ear, which is responsible for maintaining balance and spatial orientation. They can either suppress the false signals sent to the brain that cause the sensation of spinning or enhance the brain's ability to process and interpret vestibular information correctly. Antivertigo agents are often prescribed for conditions such as Meniere's disease, benign paroxysmal positional vertigo (BPPV), and vestibular neuritis, among others. They can be categorized into different types, including antihistamines, vasodilators, and others, each with its unique mechanism of action.
