### Report Overview

The application of nanomedicines in tumor treatment refers to the utilization of nanotechnology-based drug delivery systems to enhance the efficacy and safety of cancer therapies. This approach involves the development and use of nanoparticles, which are engineered at the nanoscale (1-100 nanometers), to carry therapeutic agents such as drugs, genes, or proteins directly to tumor cells. The nanoparticles can be designed to selectively target cancer cells, thereby reducing damage to healthy tissues and minimizing side effects. Additionally, nanomedicines can improve the bioavailability and stability of therapeutic agents, enhance their penetration into tumor tissues, and potentially enable controlled and sustained drug release. This targeted and precise delivery can lead to more effective tumor treatment with fewer adverse effects, ultimately improving patient outcomes and quality of life.
