Abstracts

Application virtualization software is a type of technology that allows an application to run in a host environment without installation. It enables applications to move from one computer to another via a central server. It also creates a sandbox for testing applications before they are deployed. Application virtualization software can provide benefits such as reducing system integration and administration costs, preventing conflicts with other applications, supporting legacy and cross-platform applications, and enhancing security and compliance. The future market trends of application virtualization software are driven by the increasing adoption of cloud-based technologies, the growing need for highly secure data and consolidated storage infrastructure, the rising demand for cost-effective and efficient solutions, and the emergence of 5G and IoT applications. Some of the key segments in the market are remote application virtualization, streaming application virtualization, agent-based solution, agent-less solution, private cloud, public cloud, hybrid cloud, support and maintenance services, training and consulting services, and various industry verticals such as BFSI, IT and telecom, healthcare, education, government and defense, construction, and others.
