Report Overview

Aqueous Film Coating (AFC) is a pharmaceutical excipient used in the process of film coating, which is a method employed to apply a thin, protective layer onto the surface of solid dosage forms such as tablets and capsules. This coating serves multiple purposes, including improving the appearance, taste masking, moisture protection, and extending the shelf life of the medication. AFC is preferred over organic solvent-based film coatings due to its use of water as the primary solvent, making it environmentally friendly and safer for use in pharmaceutical applications. The coating process involves dissolving the film-forming polymer in water, applying it to the dosage form, and then allowing it to dry, resulting in a uniform and smooth film that adheres to the surface of the medication.
