Abstracts

Artificial Ground Freezing (AGF) is a geotechnical technique used to stabilize soil and control groundwater during construction projects, particularly in challenging environments. The process involves lowering the temperature of the ground to below freezing, creating a solid, ice-like structure that increases soil strength and reduces permeability. This is typically achieved by circulating a coolant, such as brine or liquid nitrogen, through a series of pipes embedded in the ground. AGF is often employed in tunneling, mining, and excavation projects where conventional methods are inadequate or impractical, providing a reliable means of support and water management.

The global Artificial Ground Freezing Agf market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
