## Abstracts

Artificial liver technology refers to an extracorporeal device with functions of detoxification and metabolism, which can temporarily replace liver function, and is mainly used for adjuvant and supportive treatment of patients with liver failure and hyperbilirubinemia. Artificial livers are currently divided into non-biological artificial livers and biological artificial livers. The former is widely used. It can improve transaminases and blood coagulation functions for liver failure caused by various reasons; as for biological artificial livers, it is mainly based on the research of seed cells and biological Reactor-based. Some possible market drivers for Artificial Liver are: The increasing prevalence of liver diseases and liver failure, which require effective and timely treatment to prevent mortality and morbidity. The growing demand for alternative therapies and devices that can temporarily or permanently replace the liver function, especially for patients who are not eligible for liver transplantation or face long waiting lists. The rising innovation and development of artificial liver technologies, such as bioartificial liver systems (BALs) and molecular adsorbent recirculating systems (MARS), that can mimic the metabolic and detoxification functions of the liver using biological or synthetic components. The expanding market opportunities and customer base for artificial liver providers across different regions and industries, especially in emerging markets where the incidence of liver diseases is high and the availability of liver transplantation is low.

The global Artificial Liver market size was estimated at USD 6269.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
