Report Overview

Atmospheric LiDAR is an active optical remote sensing detection technology that uses the interaction between laser and atmospheric components for detection. It is a radar that uses laser as light source, photodetector as receiving device, and optical telescope as antenna. The working principle of LiDAR for monitoring the ambient atmosphere is: the laser emits laser pulses, which react with aerosols and various components in the atmosphere to generate backscattered signals. The detector in the system receives the echo signal and processes and analyzes it to obtain the temporal and spatial distribution parameters of atmospheric temperature and humidity, gas concentration, aerosol extinction coefficient, backscattering coefficient, etc., which is of great significance to atmospheric chemistry, atmospheric radiation, atmospheric pollution monitoring, weather forecasting, and climate model research.

This report provides a deep insight into the global Atmospheric Lidar market covering all its essential aspects. This ranges from a macro overview of the market to micro details of the market size, competitive landscape, development trend, niche market, key market drivers and challenges, SWOT analysis, value chain analysis, etc.
