Report Overview

Atmospheric Pressure Plasma Devices (APPDs) are advanced technological instruments that utilize the principles of plasma physics to generate non-equilibrium plasma at atmospheric pressure. These devices operate by ionizing gas molecules, creating a mixture of ions, electrons, and neutral particles in a plasma state. The plasma is generated at or near room temperature and atmospheric pressure, which allows for direct interaction with living tissues or materials without the need for vacuum chambers or extreme temperature conditions. APPDs have a wide range of applications, including medical treatments, surface modification of materials, environmental purification, and sterilization processes. They are designed to provide controlled and localized plasma effects, making them versatile tools in various industries and research fields.
