Abstracts

An augmented reality game engine, or AR game engine, provides game developers with the framework for creating AR video game experiences. An AR game engine often contains an augmented reality SDK, which allows developers to design, build, and test their games. These tools enable developers to create and edit 3D characters that interact with the real world. With the help of these platforms, developers can assign behaviors to 3D objects and upload them for display in a camera view. AR game engines perform similar functionality to game engine software, but are unique in that they support AR operating systems and hardware either directly or through an API. AR game engines create games for devices that support augmented reality, such as mobile phones. While some AR game engines can also create augmented reality experiences, they should not be confused with virtual reality game engines, which allow developers to create augmented reality video game experiences that superimpose 3D objects into the real world.

The global Augmented Reality Ar Game Engine market size was estimated at USD 485.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
