Abstracts

Augmented Reality (AR) is an interactive experience of a real-world environment whereby the objects that reside in the real-world are 'augmented' by computer-generated perceptual information, sometimes across multiple sensory modalities, including visual, auditory, haptic, somatosensory, and olfactory.[1] The overlaid sensory information can be constructive (i.e. additive to the natural environment) or destructive (i.e. masking of the natural environment) and is seamlessly interwoven with the physical world such that it is perceived as an immersive aspect of the real environment.[2] In this way, augmented reality alters one's ongoing perception of a real world environment, whereas virtual reality completely replaces the user's real world environment with a simulated one.[3][4] Augmented reality is related to two largely synonymous terms: mixed reality and computer-mediated reality.

The global Augmented Reality Hardware And Software market size was estimated at USD 15642.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 32.45% during the forecast period.
