Report Overview

Auricular Vagus Nerve Stimulation (aVNS) devices are medical tools designed to non-invasively stimulate the vagus nerve through the ear. These devices utilize electrical impulses delivered to the auricular branch of the vagus nerve, which is accessible at specific points on the ear. The stimulation aims to modulate neural activity to achieve therapeutic effects for a variety of conditions, such as epilepsy, depression, anxiety, and pain. aVNS devices offer a less invasive alternative to traditional vagus nerve stimulation, which typically requires surgical implantation of a stimulator. By targeting the nerve through the ear, these devices can potentially provide similar benefits with reduced risk and increased ease of use.
