Report Overview

Autoscaling software dynamically allocates or deallocates computing resources based on application needs. Such software can automatically expand resources when traffic is high and shrink resources when traffic is low. IT administrators use autoscaling software to ensure the availability of cloud systems by adding more computing resources when needed and automatically decommissioning instances when capacity needs decrease, optimizing costs. Autoscaling has some of the capabilities of cloud infrastructure monitoring software in that it continuously monitors the system to check resource usage. However, in addition to monitoring, autoscaling software can also increase or decrease capacity allocations. It also has overlapping functionality with load balancing software, a tool that distributes traffic to healthy server instances to ensure continued availability. Load balancing and autoscaling software work together to manage resources efficiently. Autoscaling software provides new instances, and load balancing software can provide connections to them.
