## Abstracts

An automated guided robotic based system is unlike a mono-path system, which is limited to one lane of lateral movement along a steel rail. An autonomous guided robotic parking system employs robots that roll freely in any direction across solid concrete slabs (including underneath parked cars) enabling faster retrievals and the ability to work around obstacles, thereby increasing system redundancy. Vehicles are parked on platforms in transfer cabins which are then collected by AGVs that drive beneath the vehicle platform, lift it, then move it out of the transfer cabin and into the system. The number of AGVs in a system is flexible, based mostly on budget and throughput requirements.

The global Automated Guided Robotic Parking System market size was estimated at USD 863.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.85% during the forecast period.
