Abstracts

An Automated Linear Parcel Sortation System is an advanced material handling solution designed to efficiently sort and route parcels and packages along a linear, straight-line conveyor. This system integrates various technologies such as conveyor belts, barcode scanners, and automated diverters to identify and direct parcels to their designated destinations accurately. As parcels move along the conveyor, they are scanned to capture barcode or RFID data, which is processed by a central control system to determine the correct sorting path. Automated diverters, such as pop-up wheels or sliding mechanisms, then redirect the parcels into appropriate chutes or lanes based on their sorting information. These systems are essential in logistics hubs, distribution centers, and postal facilities, where high-speed, high-volume sorting is required. By automating the sorting process, linear parcel sortation systems significantly enhance operational efficiency, reduce manual labor, and ensure accurate and timely delivery of parcels. They are crucial for meeting the growing demands of e-commerce and global shipping, providing a reliable and scalable solution for parcel management.

The global Automated Linear Parcel Sortation System market size was estimated at USD 1245.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
