Report Overview

Automated Projection Perimeters (APPs) refer to advanced diagnostic devices used primarily in ophthalmology to assess the visual field of a patient. These devices employ automated systems to project visual stimuli in various locations and intensities within the patient's field of vision while their responses are recorded. The automation allows for precise, consistent, and repeatable testing conditions, leading to accurate mapping of visual field deficits. APPs are crucial in detecting and monitoring conditions such as glaucoma, retinal diseases, and neurological disorders that can affect vision. By systematically testing the extent and sensitivity of a patient's visual field, APPs provide valuable information for diagnosing and managing these conditions effectively.
