Abstracts

coater and developer equipment is an indispensable key processing equipment in the integrated circuit manufacturing process. It mainly cooperates with the photolithography machine (the largest, most sophisticated, most difficult, and most expensive equipment on the chip production line). It is operated by a robot. The wafers are transported and processed between various systems to complete the photoresist coating, curing, development, film hardening and other processes of the wafers. As the input (pre-exposure photoresist coating) and output (post-exposure pattern development) of the photolithography machine, the performance of the coating/developing machine not only directly affects the formation of fine exposure patterns, but also the pattern quality and defects of its development process. Control also has a profound impact on the results of pattern transfer in many subsequent processes (such as etching, ion implantation, etc.).

The global Automatic Coater and Developer for Wafer Processing market size was estimated at USD 2705.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
